Pseudocode for Transforming Time-Series into Interval Events Without Overlapping

INPUT:

- (1) A range of slope R : (minSlope , maxSlope) specified by users,
- (2) An event category name eventCategory specified by users,
- (3) A list of time series $T_i: \{t_j\}$, each representing an ego-network
 , where T_i represents a time series with index i ,
 t_j represents a value at time step j in a time series

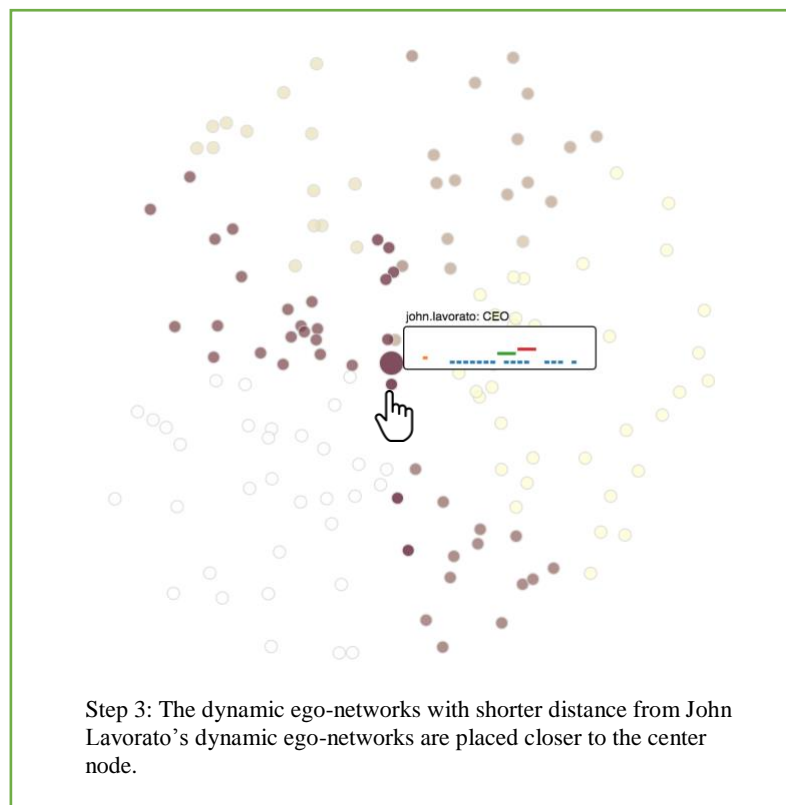

OUTPUT:

A list of interval events $I_k: (\text{category}_k, \text{start}_k, \text{end}_k)$
 , where category_k represents the event category to which the I_k belongs
 start_k represents the start time of I_k ,
 end_k represents the end time of I_k

```
FOR each time series  $T_i$ 
  FOR  $\text{startTime} = \text{earliest time point of } T_i \text{ to latest time point of } T_i$ 
    SET  $\text{currentLargestEndTime}$  to NULL
    FOR  $\text{endTime} = \text{startTime} + 1 \text{ to latest time point of } T_i$ 
      COMPUTE regression slope of  $T_i$  between  $\text{startTime}$  and  $\text{endTime}$ 
      IF regression slope is within the specified range  $R$  THEN
        SET  $\text{currentLargestEndTime}$  to  $\text{endTime}$ 
      ENDIF
    IF  $\text{endTime} = \text{latest time point of } T_i \text{ and } \text{currentLargestEndTime} \neq \text{NULL}$ 
      STORE interval event ( $\text{start}_k, \text{end}_k, \text{eventCategory}$ )
      SET  $\text{startTime}$  to  $\text{endTime}$ 
      SET  $\text{endTime}$  to  $\text{startTime} + 1$ 
    ENDIF
  ENDFOR
ENDFOR
```

Illustrations of the Steps in Creating the Radial Layout in Section 4.2.4

As described in Section 4.2.4, as analysts double-click on a node, a radial layout is created. The selected node becomes the focal node in the radial layout. The following illustrations depict the steps involved in creating a radial layout when users double-click on the node that represents John Lavorato.

Interview Questions for the Expert Review in Section 4

Q1	Does the tool help you explore a collection of ego-networks based on the questions you have about the data?
Q2	Do interactive event extraction and the pixel display help you explore your hypothesis about the similarities in the evolution patterns of a group of ego-networks and the differences in evolution patterns of different groups? How?
Q3	Does the ego-network similarity column help you understand in what way two ego-networks are similar and why an ego-network is an outlier? How?
Q4	Does the event summary view help you understand population level trends of the whole collection of ego-networks? How?
Q5	Please let us know if you have any further feedback.
